

# Introduction to Data Science

## (Lecture 23)

**Dr. Mohammad Pourhomayoun**

Assistant Professor

Computer Science Department

California State University, Los Angeles

# Map Reduce

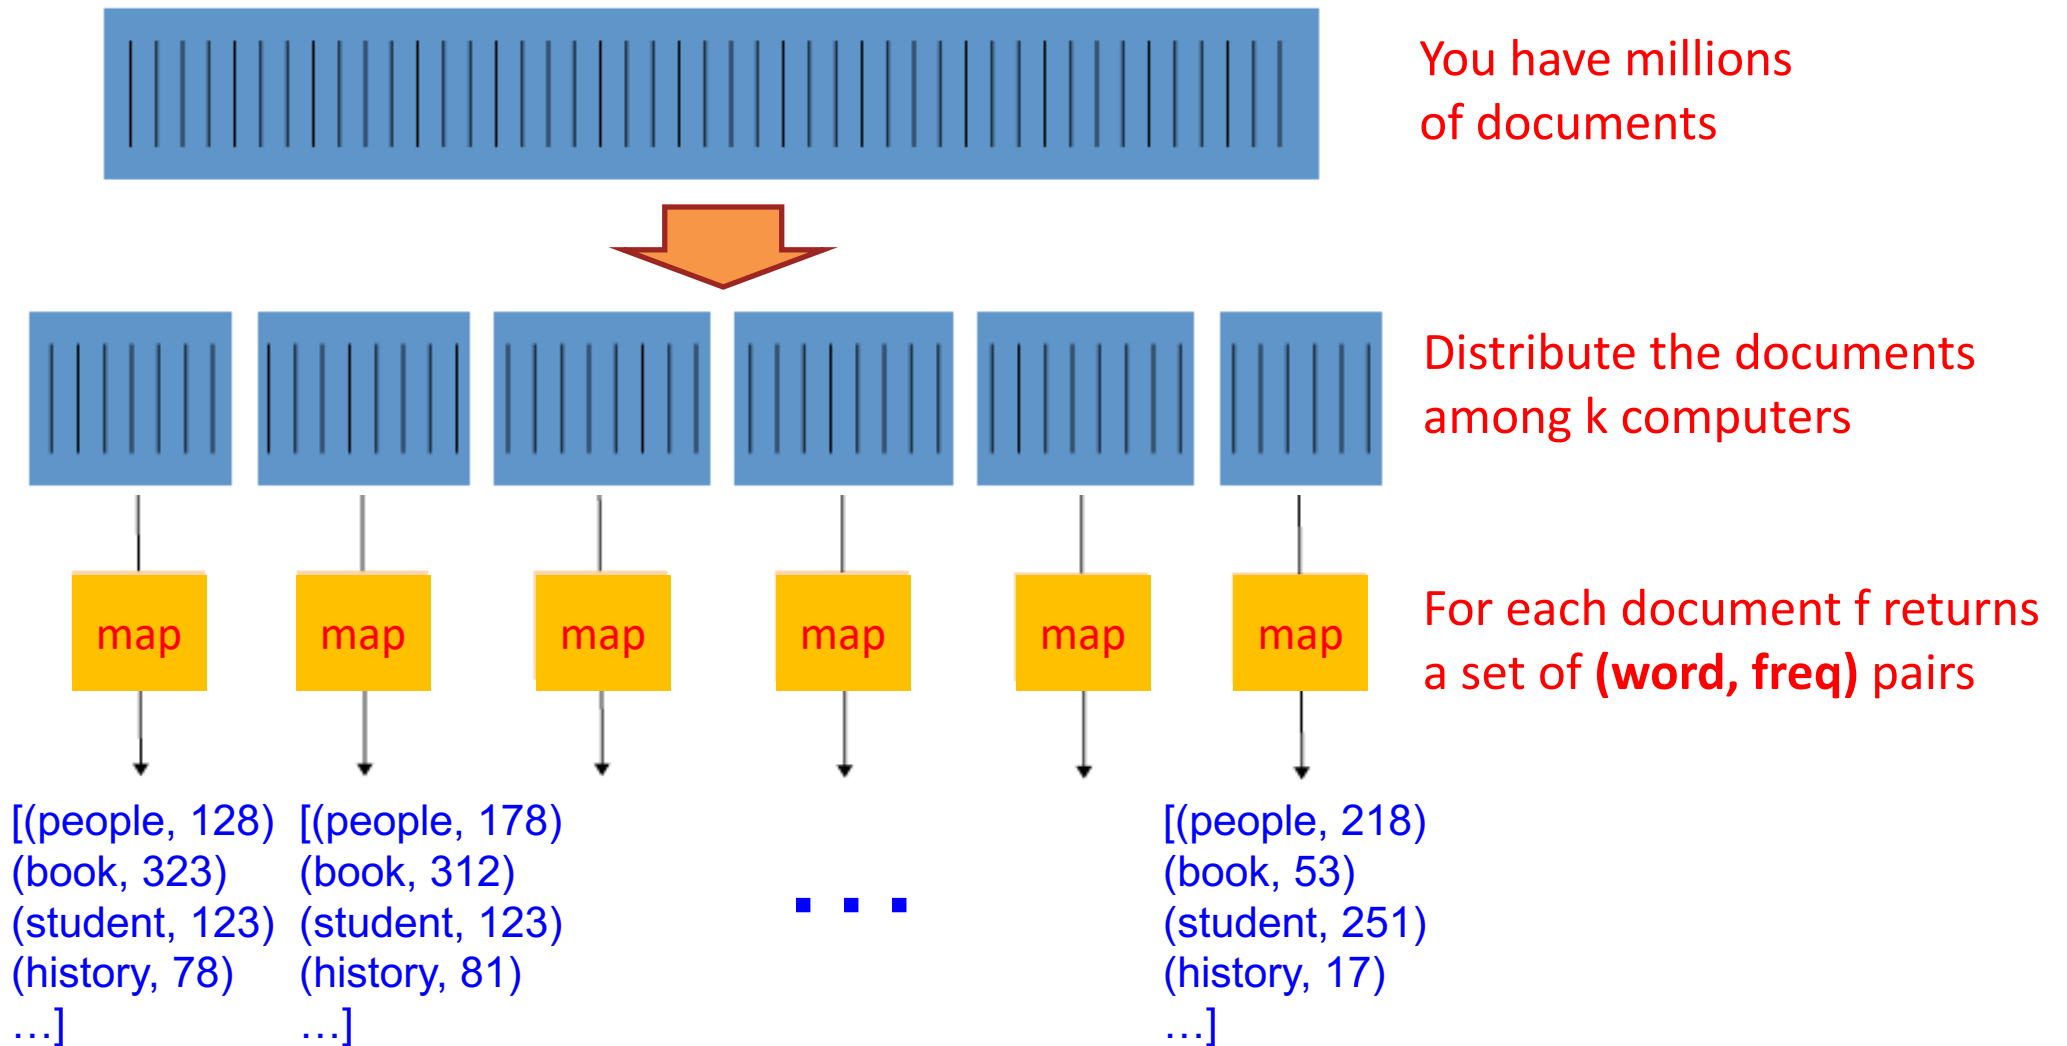

# Map-Reduce

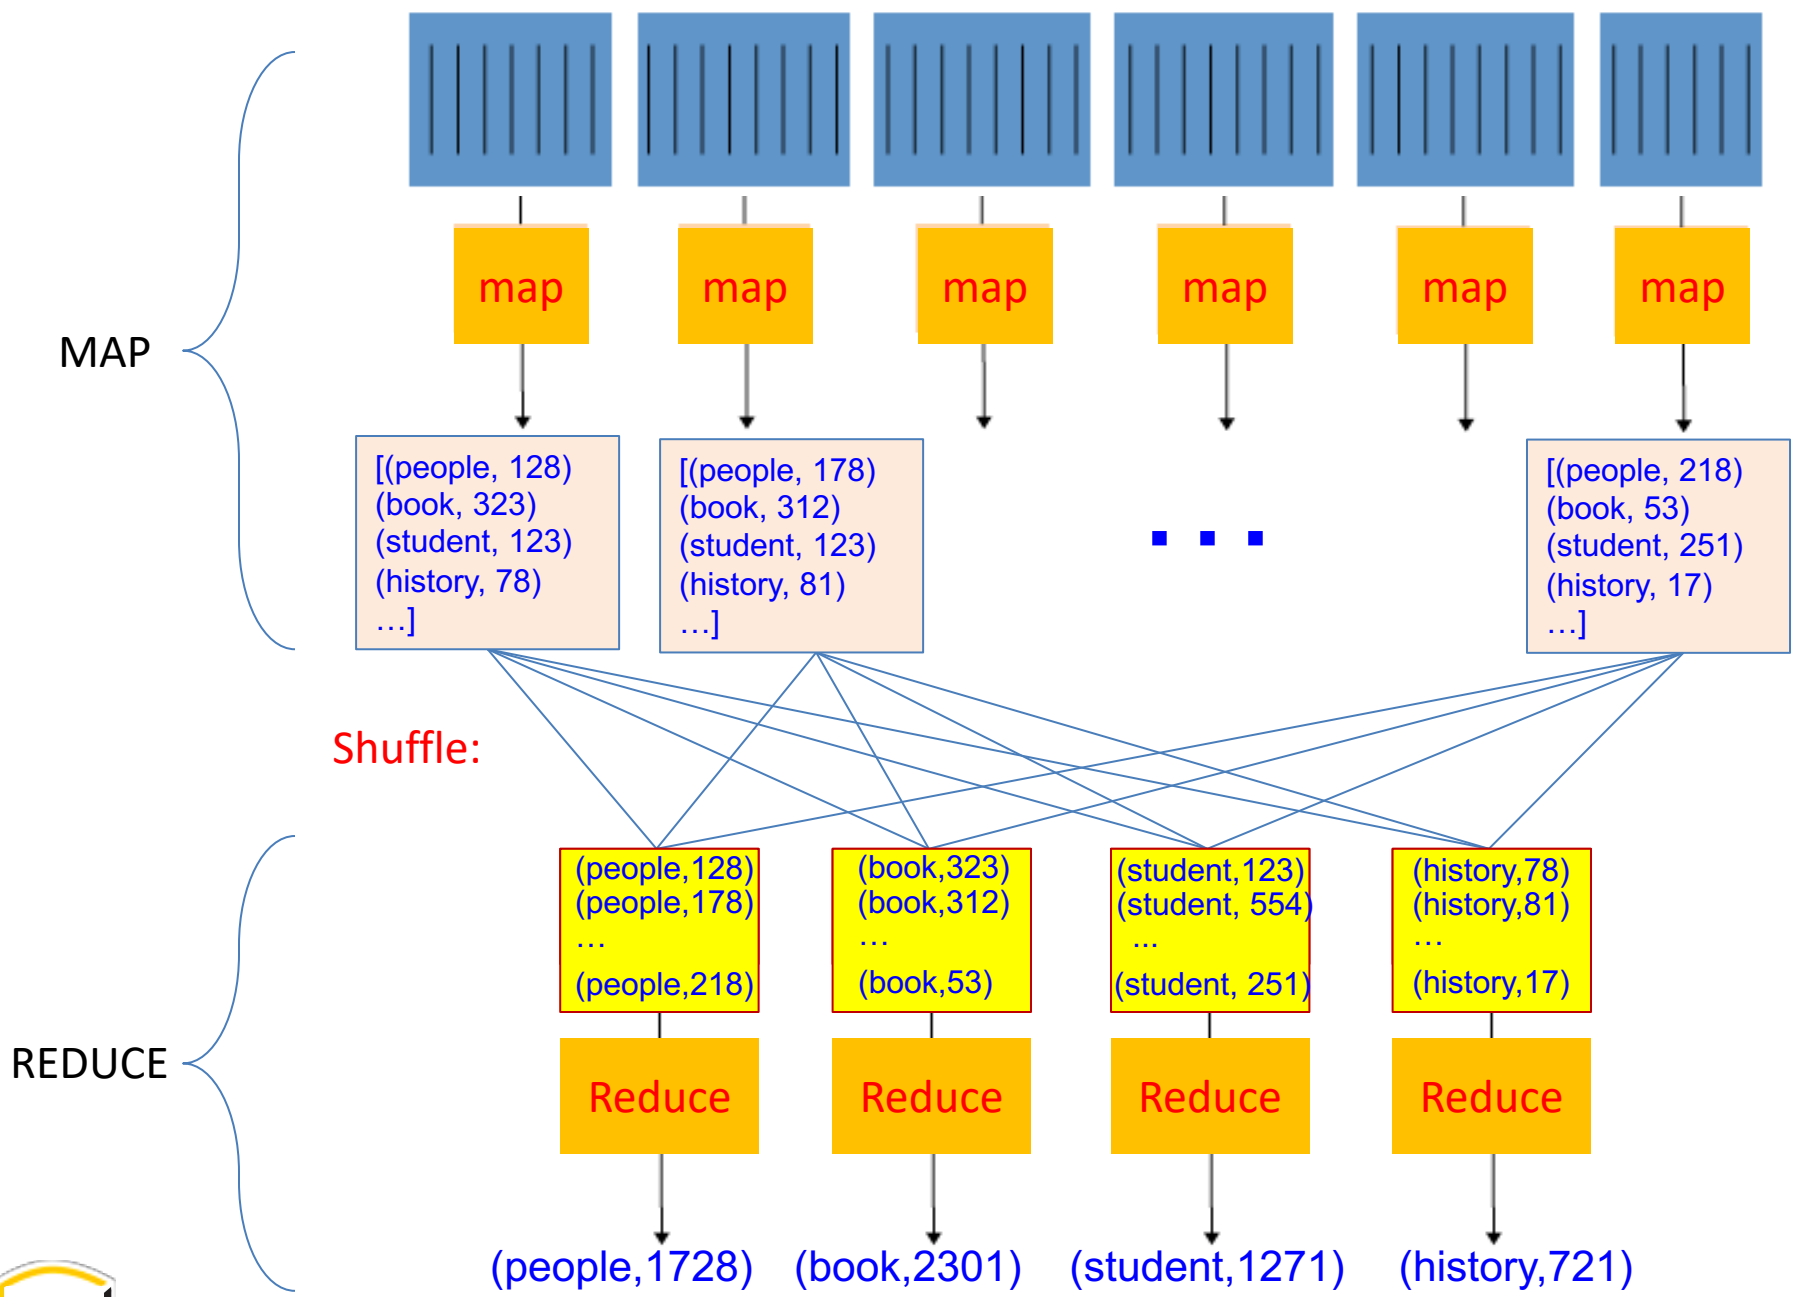

- **Map-Reduce** is a programming model for processing and generating big data sets with a parallel and distributed algorithm.
- **map function** processes input key/value pairs to generate a set of intermediate key/value pairs.
- **reduce function** merges all intermediate values associated with the same intermediate key.

[Ref]: Dean, Jeffrey & Ghemawat, Sanjay. (2004). MapReduce: Simplified Data Processing on Large Clusters. Communications of the ACM.

# Example: Compute overall word frequency across 5M docs

**Map:** Count All words in Each chunk of data

**Reduce:** Count the occurrences of Each word in the Entire data

# **Map Reduce for Relational Database Operations**

# Example: Relational Join

- **Relational Join:** Stick the tuples of two relations together when they agree on common attributes (column names).
- Consider two database tables  $R(A, B)$  and  $S(B, C)$ .
- **R JOIN S** :  $T(A, B, C)$  formed by joining rows  $(a, b) \in R$  and  $(b, c) \in S$  with **matching b**.
- **Example:**  $R(A,B) \text{ JOIN } S(B,C) = \{a,b,c \mid a,b \text{ is in } R \text{ and } b,c \text{ is in } S\}$ .

A	B
6	2
12	2
7	5

R

B	C
2	9
5	11
5	3
9	5

S

A	B	C
6	2	9
12	2	9
7	5	11
7	5	3

R JOIN S

# The Map Function for Join

- Each tuple  $(a,b)$  in  $R$  is mapped to:  
 **$\text{key} = b, \text{value} = (R,a).$** 
  - Note: “ $R$ ” in the value is just a bit to indicate “this value represents a tuple in  $R$ , not  $S$ .”
- Each tuple  $(b,c)$  in  $S$  is mapped to:  
 **$\text{key} = b, \text{value} = (S,c).$**
- After grouping by keys (shuffle), each reducer gets a key-list that looks like:  
 **$(b, [(R,a_1), (R,a_2), \dots, (S,c_1), (S,c_2), \dots]).$**

# The Map Function for Join

R =

A	B
6	2
12	2
7	5

S =

B	C
2	9
5	11
5	3
9	5

Map on R:  $\left\{ \begin{array}{l} (2, (R,6)) \\ (2, (R,12)) \\ (5, (R,7)) \end{array} \right\}$

Map on S:  $\left\{ \begin{array}{l} (2, (S,9)) \\ (5, (S,11)) \\ (5, (S,3)) \\ (9, (S,5)) \end{array} \right\}$

Shuffle

$(2, [(R,6), (R,12), (S,9)])$   
 $(5, [(R,7), (S,11), (S,3)])$   
 $(9, [(S,5)])$

# The Reduce Function for Join

- After grouping by keys, each reducer gets a key-list that looks like:

$(b, [(R, a_1), (R, a_2), \dots, (S, c_1), (S, c_2), \dots])$ .

- Reducer generates a tuple  $(a, b, c)$  for **each** pair of  $(R, a_i)$  and  $(S, c_j)$  on the list with key  $b$ .

# The Reduce Function for Join

(2, [(R,6), (R,12), (S,9)])  
(5, [(R,7), (S,11), (S,3)])  
(9, [(S,5)])

# **Map Reduce for Matrix-Vector Multiplication**

# MapReduce for Matrix Multiplication

$$\begin{matrix} A \\ \left[ \begin{array}{|c|c|c|c|c|} \hline & & & & \\ \hline & & & & \\ \hline & & & & \\ \hline & & & & \\ \hline \end{array} \right] \\ M \times N \end{matrix} \times \begin{matrix} B \\ \left[ \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} \right] \\ N \times P \end{matrix} = \begin{matrix} C \\ \left[ \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} \right] \\ M \times P \end{matrix}$$

# Matrix Multiplication

$$c_{ik} = \sum_j a_{ij} \times b_{jk}$$

# Example

$$\begin{bmatrix} 2 & 1 & 3 \\ 4 & 2 & 1 \end{bmatrix} \cdot \begin{bmatrix} 4 & 5 \\ 1 & 3 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 2 \cdot 4 + 1 \cdot 1 + 3 \cdot 2 & 2 \cdot 5 + 1 \cdot 3 + 3 \cdot 1 \\ 4 \cdot 4 + 2 \cdot 1 + 1 \cdot 2 & 4 \cdot 5 + 2 \cdot 3 + 1 \cdot 1 \end{bmatrix}$$
$$= \begin{bmatrix} 15 & 16 \\ 20 & 27 \end{bmatrix}$$

# Simple Pseudo Code for Matrix Multiplication (general approach)

```
for i = 1 to n do
  for j = 1 to n do
    for k = 1 to n do
       $C[i,j] = C[i,j] + A[i,k] \times B[k,j]$ 
    endfor
  endfor
endfor
```

# Special Case: Matrix-Vector Multiplication

- Map-Reduce originally developed by **Google** in order to compute the **PageRank** vector.

$$\begin{matrix} & \text{M} & & \text{V} & & \text{R} \\ & \left( \begin{array}{ccccc} \square & \square & \square & \square & \square \\ \textcolor{yellow}{\square} & m_{ij} & \textcolor{yellow}{\square} & \textcolor{yellow}{\square} & \textcolor{yellow}{\square} \\ \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square \end{array} \right) & \times & \left( \begin{array}{c} \textcolor{yellow}{\square} \\ \textcolor{yellow}{\square} \\ \textcolor{yellow}{\square} \\ \textcolor{yellow}{\square} \\ \textcolor{yellow}{\square} \end{array} \right) & = & \left( \begin{array}{c} \square \\ \textcolor{yellow}{\square} \\ \square \\ \square \end{array} \right) \\ \begin{matrix} \downarrow i \\ \longrightarrow j \end{matrix} & \text{M} \times \text{N} & & \text{N} \times 1 & & \text{M} \times 1 \end{matrix}$$

# Map for Matrix-Vector Multiplication

- **Map Function:**

- $N$  mappers process row  $i$  of the matrix at a time
- Mapper  $j$  Maps  $((i, j), m_{ij})$  to  $(i, m_{ij} v_j)$
- Note that We assumed that each mapper can load vector  $v$ .

# Reduce for Matrix-Vector Multiplication

- **Reduce function:**

- $M$  reducers calculate elements of vector  $R$
- Reducer  $i$  receives  $(i, [m_{i1} v_1, \dots, m_{iN} v_N])$ , sums all values of the list of a key  $i$ , and produces  $(i, R_i)$ :

$$R_i = \sum_j m_{ij} \times v_j$$
